OPERATION & SAFETY INSTRUCTIONS

ENERGY SAVING NOZZLES

INCLUDING DURABLAST LIFETIME

Models 1200, 1200SS and 9401 Blow Gun with 1200 Nozzle
Models 1201, 1201F-12, 1202 to 1206, 1220 including BSP versions

IMPORTANT

Please read all instructions BEFORE attempting to use this product

GENERAL SAFETY CONSIDERATIONS

WARNING: COMPRESSED AIR COULD CAUSE DEATH, BLINDNESS OR INJURY

1. Do not operate these Nozzles at air pressures above 150 psig (10.3 Bar).
2. Do not operate flex hose models at line temperatures above 160°F (71°C)
3. Avoid direct contact with compressed air.
4. Do not direct compressed air at any person.
5. When using compressed air, wear safety glasses with side shields.

NOTE: There is no need to limit compressed air pressure to a maximum of 30 psig (2 bar). It is not possible to block the flow of air from a Vortec Nozzle to register 30 psig (2 bar) on a test gauge.

Introduction

A Vortec Energy-Saving Nozzle is an airflow amplifier that can reduce compressed air consumption by up to 50% while helping to meet OSHA 30 psig dead-end pressure and noise specifications.

Nozzles are used as direct replacement for copper tubes, pipe nipples, manifolds with drilled holes and other conventional blowoff methods that waste compressed air.

Compressed Air Supply

The compressed air supply must be filtered to remove water and dirt using a 5 micron or smaller filter. Failure to use a filter may cause clogging of the compressed air paths inside the Vortec product. Filter recommendations are given in Table 1.

Filter elements must be changed on a regular basis. Frequency of change is determined by the condition of the compressed air supply. Filters should be installed in the compressed air supply line as close as possible to the Vortec product.

The appropriate size of compressed air supply line should be selected to ensure optimal performance of the Vortec product. Please refer to Table 2 to determine what supply line size is recommended for your application.

Contact Vortec at 1-800-441-7475 for further assistance.

Installation and Operation

To conserve compressed air, match the size of the Nozzle airflow to the shape/size of the part. Nozzles can be regulated to match the machine cycle. Output airflow volume and thrust can be changed by increasing or decreasing the compressed air supply pressure.

Models 1200 and 1200SS DuraBlast nozzles are attached to the compressed air source via the 1/8”-27 NPT threaded fitting. BSP versions of these nozzles have a 1/8”-28 BSP thread.

DuraBlast nozzles have a micrometer dial and are factory set at 0.008”. To change the airflow, loosen the set screw (recessed into the tip of the Nozzle) with a 3/32” hex Allen key, and rotate the Nozzle tip (increase gap setting = increase airflow). Tighten the set screw to secure the setting. Output airflow volume can also be changed by increasing or decreasing the compressed air pressure.

The DuraBlast nozzle is easily disassembled for cleaning. If a reduction in airflow/thrust occurs due to clogging, remove the set screw and nozzle tip and clean the air gap surface areas. After cleaning, reassemble the nozzle, adjust the gap, and tighten the set screw to secure the setting.

Models 1201, 1202, 1203 and 1205 are permanently mounted on 1/4” or 3/8” diameter copper tubing. This tubing can be bent to the desired shape with the assistance of a tube bender. The tube bender for the 1201 and 1202 nozzles must have a bend radius of no less than 9/16” (14mm) and the tube bender for the 1203 and 1205 nozzles must have a bend radius of no less than 15/16” (24mm). These models can be attached to the compressed air source with either a compression fitting or a copper solder joint fitting.

Models 1201F-12 and 1204 are attached to the compressed air source via the 1/8”-27 NPT threaded fitting. BSP versions of these nozzles have a 1/8”-28 BSP thread.

Model 1206 attaches to the compressed air source via the 1/4”-18 NPT threaded fitting. The 1206BSP has a 1/4”-19 BSP thread.

Model 1220 attaches to the compressed air source via the 3/4”-14 NPT threaded fitting.

Nozzle Identifying Features

Model	NPT/BSP Size	Copper Tube Diameter	Nozzle Sleeve	Hose Color	Thrust	
					Oz at 12"	Gm at 305 mm
1200	1/8"	-	Aluminum	-	3 to 21	85 to 205
1200SS	1/8"	-	Stainless Steel	-	3 to 21	85 to 205
1220	3/4"	-	Aluminum	-	72	2041
1201	-	1/4"	Brass	-	6	170
1202	-	1/4"	Nickel Plated	-	20	597
1203	-	3/8"	Brass	-	9	255
1205	-	3/8"	Nickel Plated	-	28	794
1201F-12	1/8"	-	Brass	Black	6	170
1204	1/8"	-	Brass	Red	9	255
1206	1/4"	-	Nickel Plated	Black	28	794

Troubleshooting

Insufficient performance may be caused by the following:

1. Undersized compressed air line size.
2. Compressed air pressure too low.
3. Partial or complete blockage of internal compressed air path, due to dirt. See Installation and Operation section for cleaning instructions; and Compressed Air Supply section for filter recommendations.
4. Insufficient compressed air volume.
5. Loose nozzle tip. This may occur if not tightened properly after disassembled for cleaning.

If trouble persists, please contact Vortec at 1-800-441-7475.

Limited Warranty

Vortec compressed air products manufactured by ITW Air Management will be replaced or repaired if found to be defective due to manufacture defect within ten years from the date of invoice.

DuraBlast nozzles are backed by a lifetime warranty and will be replaced at any time if found to be defective due to manufacture. Properly filtered air is essential to the performance and durability of Vortec nozzles. Signs of excessive wear from inadequately filtered compressed air may void this warranty.

Refer to our website **www.vortec.com** for full warranty details and limitations. ITW Air Management makes no specific warranty merchantability or warrant of fitness to a particular purpose.

Table 2: Determining Compressed Air Line Size

1. Calculate total product compressed air consumption (SCFM, SLPM).
2. Determine length of compressed air line required for connection to main supply.
3. Locate pipe length in left column and read to the right to find the compressed air requirements.
4. Locate pipe size at top of column.

MAXIMUM AIRFLOW (SCFM) THROUGH PIPE AT 5 PSIG PRESSURE DROP (100 PSIG AND 70°F)									
Pipe Length (Feet)	Pipe Size (Nominal) - Schedule 40								
	1/4	3/8	1/2	3/4	1	1-1/4	1-1/2	2	2-1/2
10	29	65	120	254	480	978	1483	2863	4536
20	21	46	85	180	340	692	1049	2024	3208
30	17	37	70	147	277	565	856	1653	2619
